Ledger Lens

Make the messy export explain itself.

Review duplicate records, conflicting identifiers and malformed values while preserving the source.

Open your workspace

Extract the entire ZIP. Open START.html in a current desktop browser. Keep the adjacent JavaScript and CSS files together. No account, installation or internet is needed for calculations. The first view contains fictional sample data.

Four steps to a useful result

1. Paste a small CSV or load your file using the source-file control. Column names are case-sensitive.

2. Map the four required columns. Use ISO dates and decimal amounts.

3. Read every flag. Repeated IDs with conflicting content flag all affected records. Exact duplicate rows remain visible.

4. Export the review CSV and keep the original. Totals exclude flagged records and never combine currencies.

Inspect before sharing

Check currency, dates, assumptions and source statements. Update workspace after editing inputs. Exports disable when inputs change so you can refresh the working view first.

Save. Review. Export.

Files and controls

Workspace JSON preserves editable inputs. Import JSON restores only this product and schema. Results CSV contains the full calculation table, even if the page shows only the first 200 rows. Brief text provides the readable handoff. Document HTML creates a simple printable document. Print / PDF uses the browser print dialog. Inspect any saved PDF before sending.

Browser storage

Save here stores a copy on this browser. Restore saved reloads it. Forget saved removes only that saved copy; the current page remains. Storage is not encrypted or synchronized. JSON export is the portable backup. Avoid sensitive records on shared devices.

Input conventions

Money inputs use one chosen currency and no automatic exchange-rate conversion. Dates use YYYY-MM-DD. Where a table uses pipe-separated text, each line is one record and every field position is required, including a final blank field. A pipe character cannot appear inside a field. Numeric zero differs from an empty value.

Scope and limitations

A structured review aid, not bank reconciliation, bookkeeping software or an automated deletion tool. Only commas are supported as delimiters; convert other formats first.

Compatibility and support

This release receives a Chrome/macOS browser acceptance check. Other browsers are not represented as certified. Run the sample before entering important data. No hosted service, provider credits, legal or financial advice is included. Read LICENSE.txt. Contact contact@jamesaisolutions.com with product/version, browser and fictional reproduction steps.

Keyboard shortcut: Command+Enter on Mac or Control+Enter updates the workspace.
